

# Industrial Diagnostics Concept

A deliberately high-level public brief focused on methods, leadership and transferable problem-solving capability.

## The problem

The academic team explored how a diagnostic concept could reduce friction in industrial maintenance while remaining viable from technical, user, ecosystem and commercial perspectives.

## My contribution

- Contributed to problem framing, concept iteration, business-model development and presentation design.
- Connected technical choices with customer value, adoption, commercial logic and rollout considerations.
- Supported the conversion of a broad challenge into a structured, presentation-ready solution narrative.

## Problem-solving method

- Start from the operational pain point rather than the technology.
- Iterate concepts when stakeholder feedback reveals redundancy or adoption barriers.
- Evaluate technical feasibility together with governance, user acceptance and business viability.
- Communicate limitations clearly and avoid presenting projections as validated outcomes.

## What this demonstrates

Cross-functional leadership, design thinking, technical-commercial translation, structured research and executive storytelling.

## Confidentiality boundary

No partner name, confidential architecture, proprietary data, internal screenshots, stakeholder quotations, operational metrics or original presentation material is included in this document.

### PUBLIC PORTFOLIO EDITION

This public brief intentionally excludes the original presentation and any confidential partner material. It is a capability summary, not a technical disclosure or company-endorsed case study.
