

Open Platform Business Model

A confidentiality-safe summary of an academic business-model innovation study.

The problem

A transaction-led incumbent faces margin pressure, rising operating complexity and digital competition. The case reframes the strategic question from improving a standalone transaction product to redesigning the value architecture.

My contribution

- Structured the business challenge across value proposition, value creation, cost structure and revenue logic.
- Connected platform economics, network effects, governance and organizational design.
- Helped translate analytical work into a concise, executive-level narrative and presentation.

Approach

- Diagnose the structural business problem before selecting technology.
- Link technical interventions to adoption, monetization and operating-model consequences.
- Separate evidence, assumptions and recommendations so the business case remains transparent.

What this demonstrates

Business-model thinking, GTM logic, platform strategy, research synthesis, stakeholder communication and the ability to turn a complex strategic challenge into a coherent decision story.

Key learning

A technically attractive intervention creates value only when the revenue model, operating model, incentives and adoption logic reinforce one another.
